INDONESIA

As the world's fourth most populous nation, Indonesia depends highly upon protein from the ocean to feed its population.

As Indonesia protects more marine areas, top priority is management: experts

by Basten Gokkon on 14 October 2022

- *The Indonesian government has pledged to secure 10% of the country's territorial waters towards biodiversity protection and sustainable use by the end of this decade, and triple the size by 2045.*
- *The move is part of the country's contribution to the global "30 by 30" conservation goal, which aims to protect 30% of the world's seas and lands by 2030.*

Indonesia Invites G20 Countries to Support Coral Reef Restoration

- The Indonesian government invites G20 countries to jointly carry out coral reef restoration in Indonesia. it is needed **improve coral health conditions in Indonesian seas.**
- "The Ministry of Marine Affairs and Fisheries (KKP) and the Ministry of Environment and Forestry (KLHK) of the Republic of Indonesia: Conservation areas have been proven to protect coastal areas on small islands and create sustainable environmental management.
- Awareness on the importance of coral reefs had started since 1998 with the existence of The Coral Reef Rehabilitation and Management Program (**Coremap**) with a total investment of more than 170.77 million US dollars.

Coral Reef in Indonesia

- Etymologically, the term coral reefs refers to coral (the collection of animals from Scleratina order) and reef (sedimentary rocks in the ocean).

Coral reefs are divided into 2:

- The soft type** is the coral reef that grows along the coast line. This type of coral does not form reefs, and they flourish very well because they get enough sun rays.
- The hard type** is corals that form calcium stones on seabeds. This type of corals is very fragile to climate changes. This is the main framer of coral reef ecosystem in the sea.

Confidence

<https://factsofindonesia.com/popular-coral-reefs-in-indonesia>

It is estimated that the total area of world's coral reefs are **284.300 km²**, and **Indonesia has 18% (85.200 km²) of the area**. This is due to the fact that Indonesia is the biggest maritime country in the world, with the marine area of **93.000 km²**. Indonesian coral reef also has the highest biodiversity in the world, with more than 2500 species of fish, 590 species of stone corals, 2500 species of mollusks, and 1500 species of crustaceans

Coral Reef in Suawesi

Taman Laut Wakatobi

This is the name of a national park located in Wakatobi regency, Southeast Sulawesi Province. This national park is a heaven and the center of the world's coral reefs .

This marine park is popular globally especially after **Wallacea Expedition** done by England which stated that this area is rich with coral species. The underwater topography is beautiful and colorful, there are **more than 112 coral live here.**

Takabonerate Sea Park

- This marine park is located in South Sulawesi, considered as the **third largest atoll** region in the world after Kwajifein in Marshall island and Suvadiva in Maldives.

Atolls here is formed as the result of volcanic eruptions which submerged 2.000 meters below the sea level.

The atoll is forming a round reef like coral reefs which is the habitat of various marine plants, nudi fish, cuttlefish, barracuda, pari, and bump head fish in the depth of one meter.

Taman Laut Bunaken

Bunaken is an 8.08 km² island which is located in Manado Bay, exactly in the northern part of Sulawesi island.

This national park represents Indonesian tropical water ecosystems which composed of mangrove ecosystems, seagrass beds, coral reefs, and land or coastal ecosystems.

There are about **91 species of fish** found in this national park. The fish such as fish gusumi horse (*Hippocampus horse*), white oci (*Seriola rivoliana*), yellow tail lolosi (*Lutjanus kasmira*), goropa (*Ephinephelus spilotoceps* and *Pseudanthias hypselosoma*), ila trunk (*Scolopsis bilineatus*), etc. This national park has **390 species of coral reefs** consists of **algae, seaweed, marine mammals, reptiles, birds, mollusks, and mangroves**.

Abstract

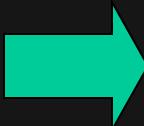

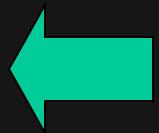

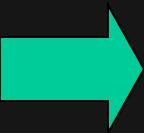

This research work aimed at investigating the chemistry and biosynthetic potential of ascidian-associated symbionts that originated from Manado Bay, North Sulawesi. We initially enriched the symbiotic cells associated with the Manadonese ascidian *Lissoclinum patella*. Subsequently we identified the presence of *Prochloron didemni* in both unenriched and salt-enriched samples by examining the 16S rRNA gene and the chlorophyll A oxygenase (CAO) gene. Investigation of the secondary metabolites by HPLC, LCMS/MS, and NMR showed the presence of ulithiacyclamide along with patellamide E in the unenriched symbiotic cells. Interestingly, ulithiacyclamide was detected in the enriched cells from the same Ascidian specimen. Molecular docking showed the high binding affinity of both compounds to estrogen receptor beta (ER-β) protein. This is a subtype of the nuclear receptor superfamily expressed abnormally in ovarian cancer cells. Furthermore, we isolated a *patE* gene variant encoding for a precursor with patellamide E (VTVCITFC) and ulithiacyclamide (CTLCCTL) core peptides from the enriched cells. This represents a new core-peptide combination. The outcome of this work provides a basis for producing useful

North Sulawesi

Manado is the capital of North Sulawesi Province, and has approx. 600.000 inhabitants.

Penutup

- Kekayaan sumberdaya hayati laut membutuhkan keseriusan pengelolaan pihak berwewenang, karena merupakan aset berharga untuk keberlanjutan generasi mendatang
- Dalam berbagai program pengembangan wilayah pesisir, seperti misalnya Malalayang Beach Walk melibatkan pendapat para ahli terkait resiko yang mungkin diakibatkan ke depan;
- Potensi molekuler yang terkandung dalam biota laut jika dieksplorasi dan dieksplorasi dengan penerapan bioteknologi yang ramah lingkungan dapat dikembangkan sebagai agen pengendali virus, anti kangker dan sebaganya
